

# Safe and Reliable Test Results Handling

Running a practice session on results handling

## How to use these tools

Discuss your practice's results handling systems

Use them to identify areas you might like to work on to improve your practice systems:

- Think about where things go wrong
- Look at the data you have collected – what does it show?
- Discuss the questions which highlight important areas for managing results
- Review the examples of communication- how does the practice communicate results?
- Think about the system from a patient's perspective
- At the end of the meeting decide what areas you need to focus on to improve and decide on specific improvements

**The World Health Organization identified that the rates of test follow-up remain ‘suboptimal’, resulting in serious lapses in patient care, delays to treatment and litigation**

## Impact on patients and relatives

- Avoidable harm and unnecessary distress
- Sub-optimal clinical management
- Delayed diagnosis and treatments
- Poor experience of, and dissatisfaction, with care
- Inconvenience of return appointments, repeating blood tests

# Significant Event Analyses (SEA) in general practice in Scotland - 19.2% of SEAs related to results handling systems

John McKay\*<sup>1</sup>, Nick Bradley<sup>2</sup>, Murray Lough<sup>2</sup> and Paul Bowie<sup>2</sup> A review of significant events analysed in general practice: implications for the quality and safety of patient care BMC Family Practice 2009, 10:61 doi:10.1186/1471-2296-10-61

## Impact on the Practice

Poor results handling is costly:

- Staff time chasing results rectifying errors
- Problem-solving system
- Repeating work tasks
- Leads to stress on staff
- Bad publicity /poor reputation

Commitment to a System Approach and Improving Safety Culture

Commitment to Staff Training and Raising Awareness of Roles & Responsibilities

Ordering laboratory tests

Obtaining a sample

Administration of samples

Transport to laboratory

Managing results returned to practice

Clinical review of laboratory results

Results actioned or filed

Patient informed and monitored through follow-up

# Results Handling Resources

- Questions to prompt practice discussion around systems for results
- Care bundle, guidance and measurement plan
- Examples of communication
- Patient questionnaire and information leaflet

## Sample of 20 patients per month who have had any of the following blood tests

On the day of the data collection each month randomly select 20 patients who had one or more of the blood tests taken 3 weeks previously

- Full Blood Count (FBC)
- Urea and Electrolytes (U&Es)
- Thyroid Function Test (TFT)
- Liver Function Tests (LFTs)

Excel spreadsheet and paper version available

## Care Bundle Measures

- Are ALL the individual blood test(s) **requested** by the clinician clearly recorded?
- Are ALL the individual blood test(s) **taken** clearly recorded?
- Have ALL the results of the blood tests ordered been returned to the practice?
- Were ALL the test(s) results forwarded to a practice clinician for review within 2 working days of being received by the practice?
- Was a definitive decision recorded by a practice clinician on ALL test results within 7 calendar days of being received by the practice?
- Have the decisions for ALL test results been 'actioned' by the practice, including the patient being informed if required?  
(Where no actions are required record as Yes)
- Have all measures been met?

## Reconciliation Measures

Have you carried out a process in the last 7 days to ensure all the FBC, U&Es, TFT and LFTs blood tests taken for ALL patients have been returned to the practice? (not just the sample of 20 patients)

If YES how many patients' results had not been returned to the practice?

# Discussion and teamwork - a systems approach

**What does your data show?**

**Where could you improve your practice systems?**

**What changes might you test?**

## Discussion Points

- Do we have agreed standards for reviewing results in a timely manner?

### Tracking

- What is our practice's tracking system for reconciling samples out with results returned and ensure appropriate clinical follow up?

### Communication

- Does our practice – including non-clinical staff – have agreed wording for communicating test results to patients? (see examples of communication)

### Training

- How are staff, including locums, trained in the results handling system?

### Patient involvement

- How does our practice help patients understand the results handling system – and when and how to access their test results? (see sample patient information leaflet)

# Improving Communication

## Admin Staff – Safety risks

Systems for tracking and reconciling are variable, problematic and require improvement

Communication from doctors can lack clarity causing frustration and unnecessary workload

“ they don’t really give us enough information to pass it onto the patient”

## Communication

- Unclear or ambiguous test result communication by doctors on reviewing results can lead to uncertainty about what action needs to take place and what should be communicated to patients
- It is suggested that all staff ensure they fully understand an **agreed set** of practice-wide terms, words and abbreviations related to the results handling process

## Example of Communication

### Examples of comments that REQUIRE action

|  |  |  |
|--|--|--|
| Add/Change Medication  | Contact patient and inform them                    | Make an appointment for bloods                   |
| Kidney function slightly abnormal – repeat in 1 week – phone patient | Make an appointment for fasting bloods             | No action today – workflow to usual GP to advise |
| Repeat test(s)   | Prescription required                              | Prescription issued                              |
| Inform Pharmacy  | Tried to contact patient – failed please try again | Inform patient acceptable                        |
| Please repeat in xxxxx weeks   | Repeat as per DMARDs protocol                      |  |
| Make URGENT in person / telephone appointment with DOCTOR            |  |  |
| Make NON URGENT in person / telephone appointment with a DOCTOR      |  |  |
| Make in person / telephone appointment with PRACTICE NURSE           |  |  |

## How could you improve communication of test results in your practice ?

### Examples of comments that DO NOT require action (or action has taken place)

|                                   |   |   |
|-----------------------------------|---|---|
| Results are normal                | Normal see task                             | Continue on current prescription  |
| Inform patient when they phone in | Patient has been informed                   | Noted reduced kidney function – no action needs to be taken                           |
| Review already organised          | Document has been seen – no action required | Results slightly out with normal range but acceptable and no further action is needed |
| GP has spoken to patient          | Nurse has already spoken to patient         |   |

NOT  
It's Mandatory

# Patient's Voice

## Patient Focus Groups

Publication highlighted lack of awareness of the results handling process

“If there’s something wrong with you I would have thought that would come straight from the doctor not the receptionist?”

“If there’s something wrong they will contact you.”

Or will they ?? Patients roles and responsibilities

## Sample patient information leaflet:

I've had a blood test taken so what happens now?

How long will I have to wait to get my test result?

How do I get my test result?

## Example of questions to learn about your patients' experience of care

1. What went well with your experience of having a blood test and receiving your result?
2. What did not go well with your experience of having a blood test and receiving your result?
3. How could your experience of having a blood test and receiving your result be improved?
4. What matters to you most when you have blood tests taken and receive your results?

## Next Steps

- Continue to collect your monthly data - display it so staff can see it
- Review your data, the changes you have tested and decide on further improvements
- Explore patients' experience of your results handling
- Discuss how you can help patients understand the system, possibly adapting the sample patient leaflet to suit your own practice
- During staff meetings review and discuss your data on a regular basis and consider getting patient feedback and decide on further improvements as required
